APRiCOT • measured spectral-novelty detection and phase-estimator handoff • 48 kHz

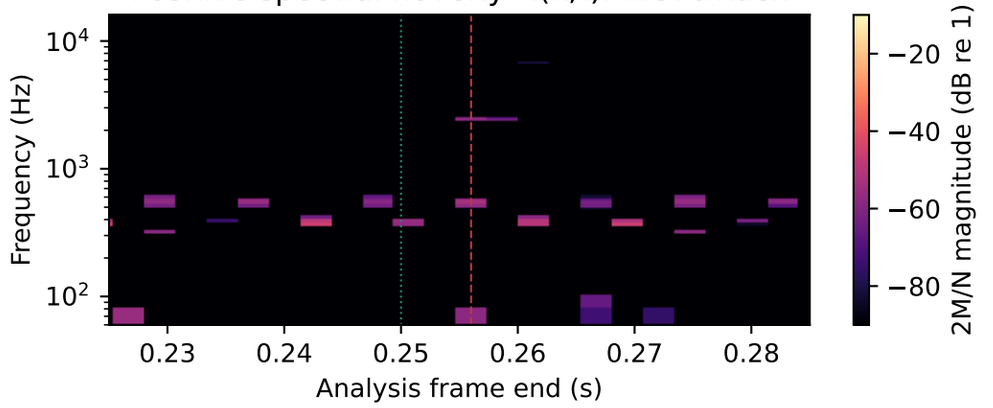

(a) Soft transients emerging under a louder sustained sound

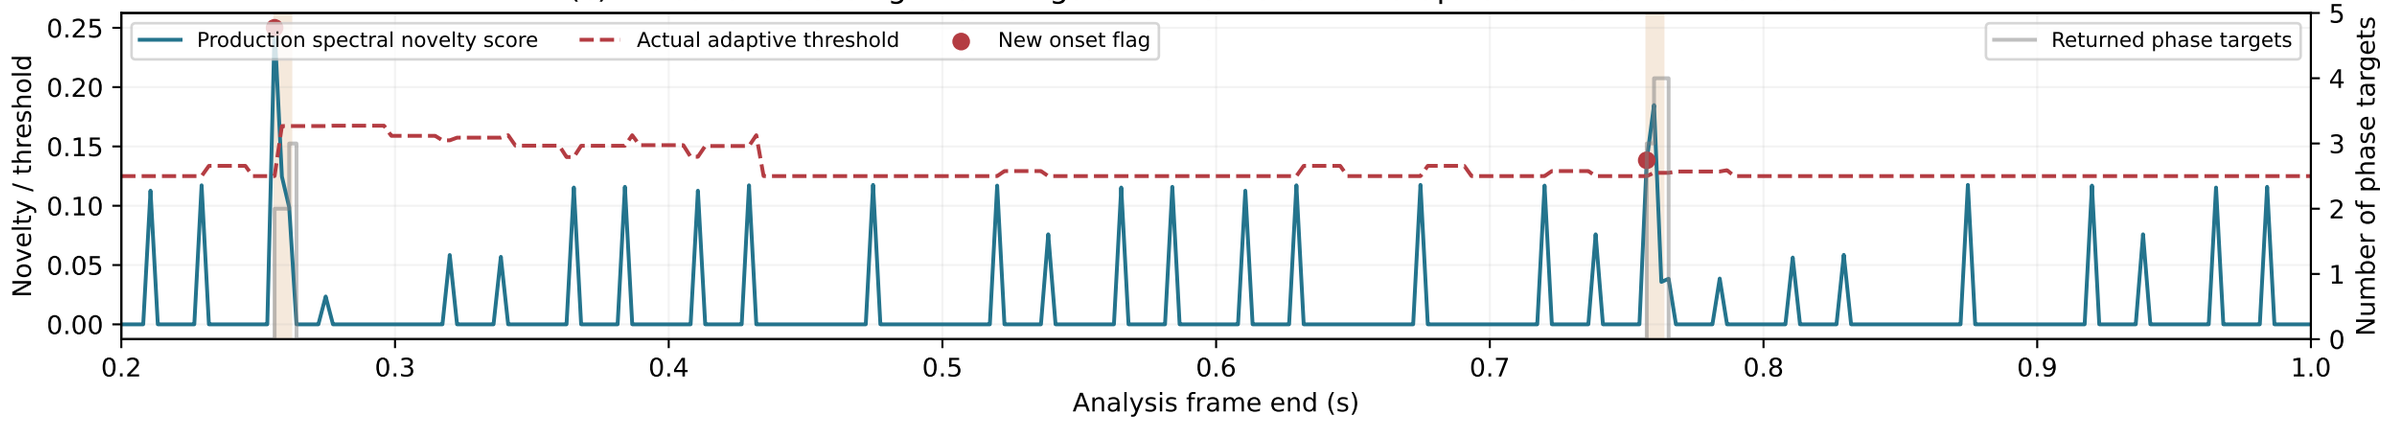

(b) Input FFT magnitude: first-attack zoom

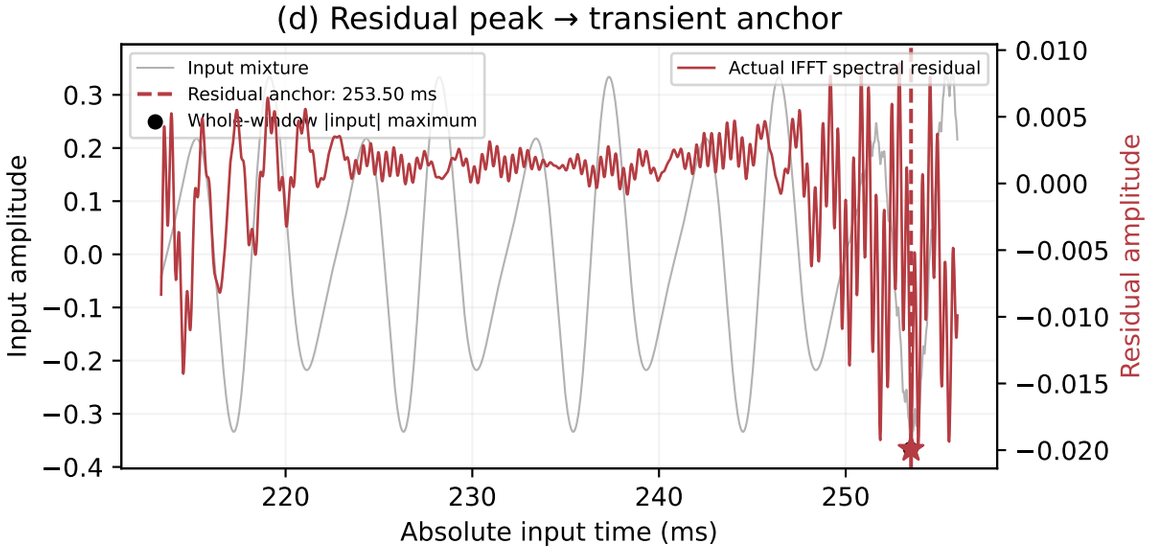

Positive spectral novelty N(k,t): first attack

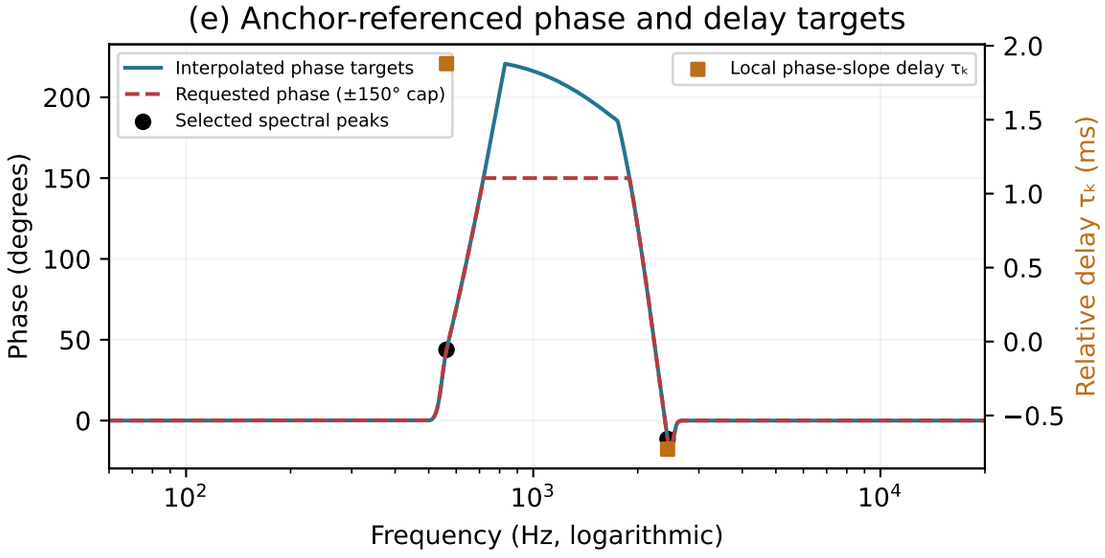

(c) Threshold crossing + event gates → new event and up to 6 ms context collection

(d) Residual peak → transient anchor

(e) Anchor-referenced phase and delay targets

N(k,t) → novelty score
adaptive threshold + event gates

→

New event + first phase estimate
frame end 256.00 ms

→

Positive residual IFFT
anchor = 253.50 ms

→

Anchor-referenced θₖ, τₖ
→ interpolated phase request
